## Yale Blade

### Enhanced Security Window Lock

Yale's Blade security window lock is a totally new concept in casement window locking.

Instead of traditional mushroom cams and shootbolts, the product features a rotating blade that projects from the Eurogroove to lock behind the striker plates on the frame.

The striker plates themselves are available with 1- or 2-screw fixing, and there is also the option of an adjustable 2-screw fix version. Because the rotating blade covers much of the length either side of the gearbox there is a great deal of flexibility in the positioning of the striker plates, which speeds up production time and reduces costly keep positioning errors.

When in the open position the rotating blade is fully retracted into the Eurogroove housing, removing issues of cam clash. This lack of mushroom cams also reduces the instances of multi-system fabricators needing to stock different versions for each system; only the backset is variable.

Blade is quick to fit with central fixings and a single screw fixing at either end as standard. This cuts down on fixing screw consumption, although double screw end fixing is available to special order if preferred.

Blade is suitable for sashes from 250 – 1599mm and is also available with an offset handle position to order.

Not only is Blade strong, but it is built to last, too. Endurance testing to 30000 cycles and a corrosion resistance rating of 240 hours (BS EN 1670 Class 4) are proof that it will stand the test of time.

Yale are so confident in Blade that it is sold with a 12 year Yale guarantee.
